NOTE: Pay the utmost attention during the disassembly of the pipe (1) from the pump module (2) because if
the intervention is not done correctly the connector of the pump module could break.

Making reference to the mentioned above specification regarding the compliance with one of the layouts of
normal production, if the displacement of the tank allows the use of the original piping, but with this pipe
the original layout of the normal production cannot be guaranteed (and therefore generate a forcing on the
assembly on the pump module connector) it is necessary to pass to the next layout, with longer piping (and
consequent reprogramming)
